8.10 Madagascar

Protected and conserved areas in Madagascar61

Madagascar has 157 protected areas covering 33,242 km² of the land and 8,998 km² of the ocean (UNEP-WCMC & IUCN, 2019k). Madagascar took the challenge from the Sydney World Parks Congress to triple the surface area of marine protected areas, an objective that has been largely achieved. Some sites are still in the process of being set up and others in the process of extension. A focus of this work is to ensure the participation of local communities. The biggest challenge currently is the effective management and sustainable funding of these protected areas. In addition, corridors of protected areas have been established over a total length of approximately 1,200 km, linking six protected areas which are part of the World Heritage Sites.

Transboundary protected and conserved areas

Madagascar includes part of the Western Indian Ocean Transfrontier Marine Park.

Policy context

A comprehensive report on legislation and policy related to protected area management, governance, and equity was undertaken by the BIOPAMA programme. It identified 75 relevant laws and policies in Madagascar (Tessema, 2019).

Key species62

Madagascar is estimated to have between 13,000 and 14,000 plant species, 80% of which are endemic. Endemism is particularly high amongst baobabs, palm trees and orchids, including six of the world’s eight species of baobab. Likewise, mammals also display a high level of endemism, particularly amongst lemurs and other primates. Madagascar is home to many different species of birds. Knowledge of the invertebrates of Madagascar is incomplete, but there are high levels of endemism amongst ants, freshwater shrimps and crabs, and crayfish. Likewise, freshwater and marine fish, amphibians, reptiles all display high levels of endemism, some close to 100%. 23 out of the 37 sea mammal species of the Western Indian Ocean Region have been observed in Madagascar’s coastal zones.

Pressures and threats63

The major threats to Madagascar’s biodiversity include: deforestation and forest degradation; illegal exploitation of natural resources, including timber, as well as many terrestrial and marine species; the impact of alien invasive species and disease; and as environmental impacts from extractive industries such as mining. Climate change remains a short and long-term threat to Madagascar’s ecosystems, particularly marine ecosystems.
